going to grab this data from gh: https://raw.githubusercontent.com/stefanbund/py3100/main/ProductList_118.csv

## The Ulta Beauty Problem

our work entails designing and delivering a business intelligence application that serves a major retail enterprise. The system ....

first, install the plotly visualization library.

```
!pip install plotly-geo
```

```
Requirement already satisfied: plotly-geo in /usr/local/lib/python3.10/dist-packages (1.0.0)
```

The command pip is the python package manager which in this case is installing a library named plotly-geo.

our system depends on the use of the pandas and numpy libraries.

```
import pandas as pd
import numpy as np
```

In python, to use a library that isn't default, you need to import it using an import statement as shown above. pandas is a library for manipulating large datasets and nucmpy is used for computing.

```
url ='https://raw.githubusercontent.com/stefanbund/py3100/main/ProductList_118.csv'
url_m = 'https://raw.githubusercontent.com/stefanbund/py3100/main/matrix.csv'
```

These two statements are setting the variables, url and url_m, to links to the class github.

```
df_m = pd.read_csv(url_m) #make a pandas dataframe
```

As mentioned in the comment, this creates a dataframe using the link specified in the variable url_m.

```
df_m
```

This code snippet calculates the percentage of values in each row of the DataFrame df_m that are less than or equal to the 25th percentile value (kk[0.25]). It does so by summing the boolean results of the comparison for each element in the row, dividing by the total number of columns in the DataFrame (df_m.shape[1]), and then multiplying by 100 to convert the result to a percentage. The result is a Pandas Series named n containing the calculated percentages for each row.

```
la = df_m['25qt'] = round(((df_m.iloc[:, 1:] <= kk[0.25]).sum(axis=1) / df_m.shape[1]) * 100,1)
ll = df_m['50qt'] = round(((df_m.iloc[:, 1:] <= kk[0.50]).sum(axis=1) / df_m.shape[1]) * 100,1)
lll = df_m['75qt'] = round(((df_m.iloc[:, 1:] <= kk[0.75]).sum(axis=1) / df_m.shape[1]) * 100,1)
print(la, ll, lll)
```

This code calculates the percentage of values below the 25th, 50th, and 75th percentiles in each row of the DataFrame df_m, rounding the results to one decimal place. The calculated percentages are stored in new columns '25qt', '50qt', and '75qt' in the DataFrame, and the resulting Series objects Ia, II, and III are printed.

This sums the values of each of the rows and outputs them in a neat manner

```
# df_m
```

```
end_set = ['City','25qt','50qt','75qt']
df_m[end_set]
```

| | City | 25qt | 50qt | 75qt |
|---|---|---|---|---|
| 0 | Birmingham | 28.6 | 55.8 | 77.3 |
| 1 | Montgomery | 21.4 | 55.8 | 70.5 |
| 2 | Mobile | 38.1 | 60.5 | 79.5 |
| 3 | Huntsville | 26.2 | 51.2 | 77.3 |
| 4 | Tuscaloosa | 21.4 | 60.5 | 79.5 |
| 5 | Hoover | 16.7 | 34.9 | 59.1 |
| 6 | Dothan | 19.0 | 55.8 | 90.9 |
| 7 | Auburn | 23.8 | 51.2 | 79.5 |
| 8 | Decatur | 21.4 | 46.5 | 70.5 |
| 9 | Madison | 28.6 | 48.8 | 75.0 |
| 10 | Florence | 26.2 | 48.8 | 63.6 |

[25 rows x 46 columns]
```

This code creates a Pandas DataFrame named df with columns 'City' and 'Zip Code' using a sample dataset of cities and their corresponding zip codes in Alabama. Subsequently, a list of zip codes is assigned as a new column 'zip' in the DataFrame df_m, and the resulting DataFrame is printed. Note that there seems to be a slight inconsistency in the variable names (df and df_m), and it might be more accurate to use the same variable name consistently throughout the code.

experiment with chloropleths

```
df_m.columns
```

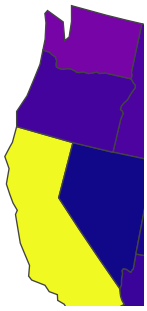
```
Index(['City', '1', '2', '3', '4', '5', '6', '7', '8', '9', '10', '11', '12',
       '13', '14', '15', '16', '17', '18', '19', '20', '21', '22', '23', '24',
       '25', '26', '27', '28', '29', '30', '31', '32', '33', '34', '35', '36',
       '37', '38', '39', '40', '41', '25qt', '50qt', '75qt', 'zip'],
      dtype='object')
```

```
import plotly.express as px
import pandas as pd

# Load data
df_demo = pd.read_csv('https://raw.githubusercontent.com/plotly/datasets/master/2011_us_ag_exports.csv')

# Create choropleth map
fig = px.choropleth(df_demo, locations='code', locationmode='USA-states', color='total exports', scope='usa')

# Show map
fig.show()
```



This code snippet uses Plotly Express to create a choropleth map of the United States. It loads data from a CSV file containing information about 2011 agricultural exports by U.S. state, then creates a choropleth map with state codes as locations, total exports as the color parameter, and displays the map using fig.show().

```
df_demo
```

| | code | state | category | total exports | beef | pork | poultry | dairy | fruits fresh | fruits proc |
|---|---|---|---|---|---|---|---|---|---|---|
| 0 | AL | Alabama | state | 1390.63 | 34.4 | 10.6 | 481.0 | 4.06 | 8.0 | 17.1 |

| 15 | KS | Kansas | state | 4589.01 | 659.3 | 179.4 | 6.4 | 65.45 | 1.0 | 2.1 |
| 16 | KY | Kentucky | state | 1889.15 | 54.8 | 34.2 | 151.3 | 28.27 | 2.1 | 4.5 |
| 17 | LA | Louisiana | state | 1914.23 | 19.8 | 0.8 | 77.2 | 6.02 | 5.7 | 12.1 |

```
df_demo.columns
```

```
Index(['code', 'state', 'category', 'total exports', 'beef', 'pork', 'poultry',
       'dairy', 'fruits fresh', 'fruits proc', 'total fruits', 'veggies fresh',
       'veggies proc', 'total veggies', 'corn', 'wheat', 'cotton'],
      dtype='object')
```

The df_demo.columns command returns the column labels of the DataFrame df_demo. It provides a list of the column names present in the DataFrame, which can be useful for inspecting the structure of the data.

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 24 | MO | Missouri | state | 3933.42 | 137.2 | 277.3 | 196.1 | 34.26 | 4.2 | 9.0 |

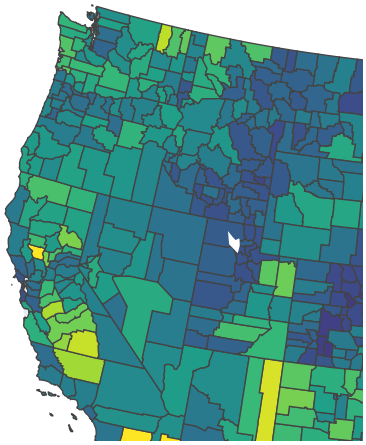
map demo #2: state of AL

```
from urllib.request import urlopen
import json
with urlopen('https://raw.githubusercontent.com/plotly/datasets/master/geojson-counties-fips.json') as response:
    counties = json.load(response)

import pandas as pd
df_us = pd.read_csv("https://raw.githubusercontent.com/plotly/datasets/master/fips-unemp-16.csv",
                    dtype={"fips": str})

import plotly.express as px

fig = px.choropleth(df_us, geojson=counties, locations='fips', color='unemp',
                           color_continuous_scale="Viridis",
                           range_color=(0, 12),
                           scope="usa",
                           labels={'unemp':'unemployment rate'})
fig.update_layout(margin={"r":0,"t":0,"l":0,"b":0})
fig.show()
```



This code utilizes Plotly Express to create a choropleth map of the United States with county-level data. It loads GeoJSON data for U.S. counties from a specified URL and a CSV file containing unemployment rates for each county. The px.choropleth function is then used to create the map, specifying the GeoJSON data, column names for locations and colors, color scale, range, and labels

```
df_us.columns
```

```
Index(['fips', 'unemp'], dtype='object')
```

The df_us.columns command returns the column labels of the DataFrame df_us.

```
df_us
```

    {'County':'Houston', 'FIPS Code' : '28069'},
    {'County':'Jackson', 'FIPS Code' : '28071'},
    {'County':'Jefferson', 'FIPS Code' : '28073'},
    {'County':'Lamar', 'FIPS Code' : '28073'}]
len(al_fips)
```

```
25
```

This Python code defines a list of dictionaries named al_fips, where each dictionary represents a county in Alabama with entries for the county name and its corresponding FIPS code. The list contains 27 county entries, and the length of the list (27) is calculated using the len(al_fips) expression.

```
df_m.columns
```

```
Index(['City', '1', '2', '3', '4', '5', '6', '7', '8', '9', '10', '11', '12',
       '13', '14', '15', '16', '17', '18', '19', '20', '21', '22', '23', '24',
       '25', '26', '27', '28', '29', '30', '31', '32', '33', '34', '35', '36',
       '37', '38', '39', '40', '41', '25qt', '50qt', '75qt', 'zip'],
      dtype='object')
```

This shows the column information from df_m

```
df_m
```

| | City | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | ... | 36 | 37 | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | Birmingham | 8285 | 5343 | 6738 | 6635 | 5658 | 8118 | 4311 | 8535 | 3436 | ... | 3555 | 1341 | 17 |

| **8** | Decatur | 3786 | 2891 | 8124 | 2469 | 3704 | 3623 | 2409 | 8287 | 2032 | ... | 9305 | 6509 | 68 |

This outputs the dataframe

```
df_m.shape[0]
```

```
25
```

This shows the shape of the dataframe

transform al_fips, the list of county fps codes, into a pandas dataframe

```
print(len(al_fips))
df_counties = pd.DataFrame(al_fips)
df_counties.size
```

```
25
50
```

prints the length of the list al_fips using print(len(al_fips)), which is 27 in this case. Then, it creates a Pandas DataFrame named df_counties from the list of dictionaries al_fips and calculates the size of the DataFrame using df_counties.size

```
print(df_counties.columns)
```

```
Index(['County', 'FIPS Code'], dtype='object')
```

df_m: all display data, per store

```
df_m.shape[0]
```

```
25
```

fips codes per county

```
df_counties.shape[0]
```

```
25
```

Once again this shows the shape of the df_counties dataframe

```
df_counties.columns
```

```
Index(['County', 'FIPS Code'], dtype='object')
```

merge the county fips codes with the stores sales results (df_m)

```
merged_df = pd.concat([df_m, df_counties], axis=1)
merged_df.head()
```

| | City | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | ... | 38 | 39 | 4 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | Birmingham | 8285 | 5343 | 6738 | 6635 | 5658 | 8118 | 4311 | 8535 | 3436 | ... | 1756 | 7598 | 150 |
| **1** | Montgomery | 1287 | 6585 | 8300 | 8874 | 8208 | 5363 | 3552 | 3387 | 2765 | ... | 4449 | 5727 | 23 |
| **2** | Mobile | 8035 | 5569 | 9492 | 5905 | 5024 | 1107 | 6937 | 5580 | 8044 | ... | 9296 | 2815 | 48 |
| **3** | Huntsville | 6280 | 2841 | 3399 | 5448 | 6173 | 5451 | 7488 | 9981 | 5236 | ... | 9982 | 3338 | 91 |
| **4** | Tuscaloosa | 4079 | 1066 | 3923 | 4177 | 4277 | 4219 | 9436 | 8160 | 4302 | ... | 4469 | 2513 | 813 |

This code horizontally concatenates two DataFrames, df_m and df_counties, along their columns (axis=1). The resulting DataFrame, named merged_df, contains the columns from both DataFrames side by side. The head() method is then used to display the first few rows of the merged DataFrame.

use the merged_df as data source for the choropleth

```
merged_df.columns
```

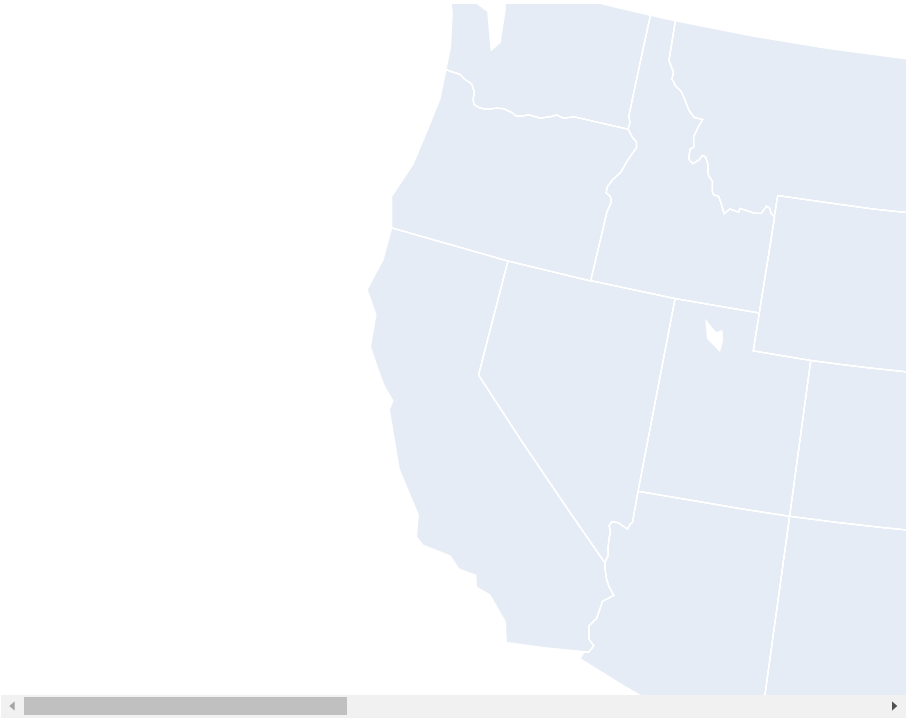
```
Index(['City', '1', '2', '3', '4', '5', '6', '7', '8', '9', '10', '11', '12',
       '13', '14', '15', '16', '17', '18', '19', '20', '21', '22', '23', '24',
       '25', '26', '27', '28', '29', '30', '31', '32', '33', '34', '35', '36',
       '37', '38', '39', '40', '41', '25qt', '50qt', '75qt', 'zip', 'County',
       'FIPS Code'],
      dtype='object')
```

This displays the column names of the merged_df dataframe

use the plotly api, feed it the merged_df information to do a map, with encoded quantile values

```
import plotly.express as px

fig = px.choropleth(merged_df, geojson=counties, locations='FIPS Code', color='25qt',
                           color_continuous_scale="Viridis",
                           range_color=(0, 38),
                           scope="usa",
                    hover_name="City",
                    hover_data=["City"],
                           labels={'25qt':'percentage displays under 25th qt'}  #
                          )
fig.update_layout(margin={"r":0,"t":0,"l":0,"b":0})
fig.show()
```



This code uses Plotly Express to create a choropleth map based on the merged DataFrame merged_df. The map is constructed using GeoJSON data for U.S. counties (counties) and displays the percentage values from the '25qt' column. The map is customized with a specified color scale, color range, and hover information, and it is then displayed using fig.show(). Note that 'FIPS Code' is used as the location identifier in the choropleth map.

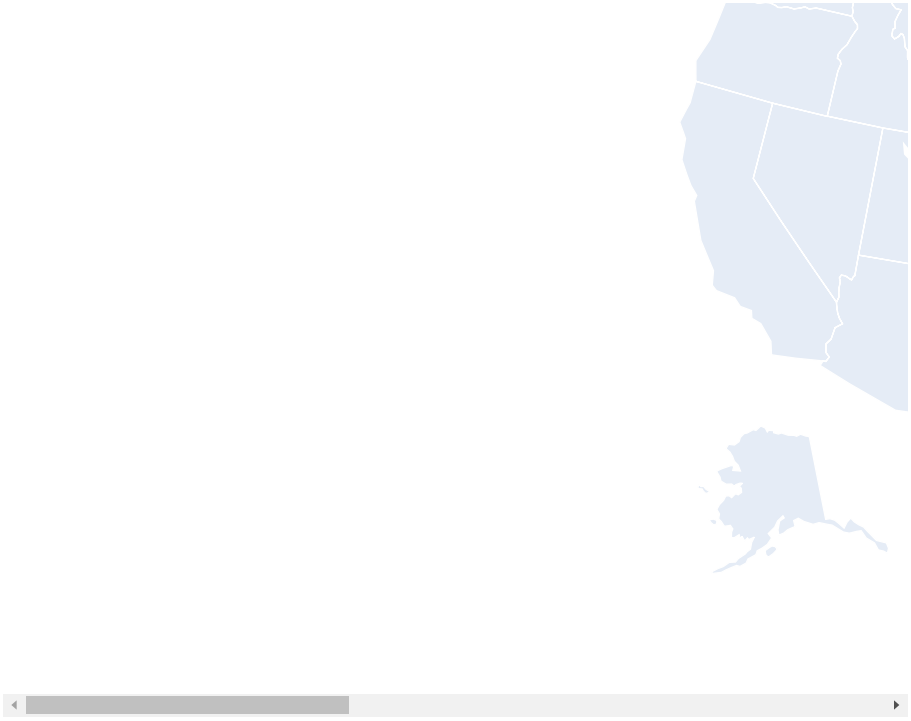
```
import plotly.express as px
import requests
import json
import pandas as pd

# Load the geojson data for Alabama's counties
r = requests.get('https://raw.githubusercontent.com/plotly/datasets/master/geojson-counties-fips.json')
counties = json.loads(r.text)

# Filter the geojson data to only include Alabama's counties
target_states = ['01']
counties['features'] = [f for f in counties['features'] if f['properties']['STATE'] in target_states]

# Load the sample data for Alabama's counties
df = pd.read_csv('https://raw.githubusercontent.com/plotly/datasets/master/fips-unemp-16.csv', dtype={'fips': str})

# Create the choropleth map
fig = px.choropleth(df, geojson=counties, locations='fips', color='unemp',
                    color_continuous_scale='Viridis', range_color=(0, 12),
                    scope='usa', labels={'unemp': 'unemployment rate'})
fig.update_layout(margin={'r': 0, 't': 0, 'l': 0, 'b': 0})
fig.show()
```



This Python code uses Plotly Express to create a choropleth map of Alabama's counties based on unemployment rate data. It loads GeoJSON data for U.S. counties, filters it to include only Alabama's counties, and then loads sample unemployment rate data for these counties. The resulting choropleth map visualizes the unemployment rates, with a specified color scale and range, and is displayed using fig.show(). The layout is adjusted to remove margins for a cleaner presentation.
